this text is an unbound binder ready edition students often say i studied 40 hours for this exam and i still didnt do well where did i go wrong most instructors hear this complaint every year in many cases it is true that the student invested countless hours only to produce abysmal results often inefficient study habits are to blame the important question is why do so many students have difficulty preparing themselves for organic chemistry exams there are certainly several factors at play here but perhaps the most dominant factor is a fundamental disconnect between what students learn and the tasks expected of them to address the disconnect in organic chemistry instruction david klein has developed a textbook that utilizes a skills based approach to instruction the textbook includes all of the concepts typically covered in an organic chemistry textbook but special emphasis is placed on skills development to support these concepts this emphasis upon skills development will provide students with a greater opportunity to develop proficiency in the key skills necessary to succeed in organic chemistry as an example resonance structures are used repeatedly throughout the course and students must become masters of resonance structures early in the course therefore a significant portion of chapter 1 is devoted to drawing resonance structures two chapters 6 and 12 are devoted almost entirely to skill development chapter 6 emphasizes skills that are necessary for drawing mechanisms while chapter 12 prepares the student for proposing syntheses in addition each chapter contains numerous skillbuilders each of which is designed to foster a specific skill each skillbuilder contains three parts 1 learn the skill a solved problem that demonstrates a particular skill 2 practice the skill numerous problems similar to the solved problem that give the students an opportunity to practice and master the skill 3 apply the skill one or two more challenging problems in which the student must apply the skill in a slightly different environment these problems include conceptual cumulative and applied problems that encourage students to think out of the box sometimes problems that foreshadow concepts introduced in later chapters are also included all skillbuilders are visually summarized at the end of each chapter skillbuilder review followed by a list of suggested in chapter and end of chapter practice problems david klein is a lecturer at johns hopkins university where he teaches organic and general chemistry he is a dynamic and creative teacher and uses analogy to help students grasp difficult topics kleins unique informal voice and manner of presentation help students truly master key topics in this course he is also the author of organic chemistry as a second

language and general chemistry as a second language which have both been highly successful

photochemistry in microheterogeneous systems provides an introduction to the subject of photochemistry in microheterogeneous systems emphasis is on the unimolecular and bimolecular reactions of electronically excited molecules in non homogeneous media as well as the application of photophysical and photochemical processes and techniques to the study of various microheterogeneous systems of chemical and biological interest from normal and inverted micelles to vesicles and liposomes monolayers black lipid membranes and liquid crystalline solvents this monograph is comprised of 10 chapters and begins with an overview of microheterogeneous systems excited state processes and reactions photochemistry in microheterogeneous systems and structural and

dynamical aspects of micellar aggregates the discussion then turns to micellar photophysics and photochemistry with emphasis on singlet state and triplet state reactions subsequent chapters focus on photoprocesses in a variety of microheterogeneous systems such as reversed micelles microemulsions lipids surfactant vesicles and liposomes polymers polyelectrolytes and ion exchange membranes and molecular inclusion complexes the final chapter is devoted to the photochemistry of molecules in the adsorbed state this text is intended for graduate students and practicing chemists

during the last decade various powerful experimental tools have been developed such as small angle x ray and neutron scattering x ray and neutron reflection from interfaces neutron spin echo spectroscopy and quasi elastic multiple light scattering and large scale computer simulations due to the rapid progress brought about by these techniques one witnesses a resurgence of interest in the physicochemical properties of colloids surfactants and macromolecules in solution although these disciplines have a long history they are at present rapidly transforming into a new interdisciplinary research area generally known as complex liquids or soft condensed matter physics names that reflect the considerable involvement of the chemical and condensed matter physicists this book is based on lectures given at a nato asi held in the summer of 1991 and discusses these new developments both in theory and experiment it constitutes the most up to date and comprehensive summary of the entire field
